MEMORANDUM FOR: Assistant for Technical Development, NPIC

ATTENTION :

SUBJECT : Evaluation of the [] Twin Light Source Table

1. The light table with measuring stage has been evaluated by the Photographic Analysis Group with the conclusion that its primary use will be for stereoscopic viewing of large film chips which are used with difficulty on the light bases currently available. The mensuration capability of the table can be improved by removing extraneous motion of the traversing stage and stabilizing the vertical post. It was also determined that there was play between the movement of the stage and the measuring dial. If this and accompanying noise evident during movement of the dial, could be reduced the table would be more acceptable.

2. It is the opinion in PAG that serious consideration should be given to procurement of a reticule (open cross with a dot in the center) which is specifically designed for PI mensuration procedures.
